Q1 2026 Operations Report

Internal draft for the management board · prepared by: Claire Hobbs (back office) · 6 April 2026

1. Quarter summary

Q1 2026 closes as the best quarter in the company's history. We completed **55 solar installations with a total capacity of 516.4 kWp**, translating into **$981k of net revenue** (+34% YoY). Growth continues to be driven by the commercial segment (workshops, warehouses, retail buildings), which accounted for roughly 61% of installed capacity. March was the single best month in company history — 24 installations and 231.8 kWp — which we attribute to the newly started cooperation with the VoltWorks subcontractor crew and the usual pre-summer pickup.

The quarter also saw the launch of our referral program, the signing of a framework agreement with a regional property manager covering 14 buildings, and the first full quarter of the reorganized service desk. Headcount at the end of March: 19 (16 at the end of December).

2. Sales and delivery results

Month	Installations	Installed capacity (kWp)	Net revenue ($k)
January	14	128.4	244
February	17	156.2	297
March	24	231.8	440
Q1 2026 total	**55**	**516.4**	**981**

Data source: company CRM (sales + delivery module), as of 5 April 2026. The full installation register is attached as Appendix A.

3. Monthly commentary

January. A slow start typical for the season — two weeks of hard frost pushed four scheduled roof installations into February. The month was carried by two commercial projects: a 22.4 kWp carport-and-roof system for a car dealership and an 11.3 kWp system for a bakery chain's production site. Residential demand was steady but price-sensitive; the average discount granted rose to 4.1% (3.2% in Q4).

February. A clean execution month: 17 installations, zero weather days lost, and the first fruits of the referral program (3 of the 17 jobs came from referrals). We signed the subcontracting agreement with VoltWorks on 21 February to add roofing capacity in the North region, where our own two crews had a five-week order backlog.

March. Record volume. VoltWorks delivered their first full month, focused entirely on residential jobs in the North region, while our own crews concentrated on three larger commercial projects (30.2, 21.6 and 14.6 kWp). Note: with two teams reporting into the CRM for the first time, the back office flagged reconciliation work in progress at the time of writing — see also the ops meeting notes of 7 April.

4. Regional structure

We operate in three regions: North, Central and South. The North region accounts for close to half of the quarter's installed capacity (approx. 50%), which supports the case for locating the planned inverter warehouse there. A detailed month-by-month breakdown of capacity per region is shown in the chart generated from the commissioning sign-off system (attached separately).

North. Our strongest region and the focus of the VoltWorks cooperation. The pipeline there remains the deepest: 17 of the 31 signed contracts awaiting delivery are in the North. Competition is intensifying — two national installers opened local branches in Q1 — but our lead times (3–4 weeks vs their quoted 8+) remain the decisive argument.

Central. Stable, commercially-tilted region; the framework agreement with the property manager (14 buildings, audits scheduled April–May) should convert into 6–8 installations in H2. Average system size here is the largest of the three regions.

South. Smallest but growing; mostly residential. The region is served by a single crew and scheduling remains tight — one crew sickness in January cost us two delivery slots. A second South crew is part of the Q2 recruitment plan.

5. Customer segments

Commercial (61% of capacity). 14 installations. Decision cycles are long (median 47 days from offer to signature) but ticket sizes and margins justify the effort. The three largest March projects were all repeat or referred customers. We introduced a standardized ROI one-pager in February, which shortened the second-meeting-to-signature time noticeably.

Residential (39% of capacity). 41 installations, average size 4.6 kWp. Demand is healthy but the market is loud: customers arrive with three or four competing offers. Financing partnerships (two banks, one leasing company) were used in 44% of residential deals, up from 31% in Q4.

6. Marketing and lead generation

The referral program launched 15 January produced 9 qualified leads and 5 signed contracts in the quarter, at a cost per acquisition roughly a third of paid channels. Paid search spend was held flat; the website refresh (new calculator, case studies) shipped 28 February and conversion from visit to inquiry improved from 1.9% to 2.6% in March. The spring home-and-garden fair (14–16 March) generated 61 conversations and 18 follow-up appointments.

7. Operations and crews

We ran two own installation crews for most of the quarter, plus the VoltWorks crew from March. Crew utilization averaged 87% (Jan 71%, Feb 93%, Mar 96%) — the March figure is above our sustainable target and was only possible because commissioning paperwork was batched to Fridays. The second 12 m ladder and a replacement drill set for Crew B remain open purchases. One minor safety incident was recorded (dropped panel, no injury, panel written off); the toolbox-talk cadence was increased to weekly.

Scheduling remains our operational bottleneck: reschedules caused by weather or customer availability still consume 3–5 crew-days per month. A shared calendar integration between the CRM and the crews' phones is in testing and should ship in April.

8. Service and quality

We recorded a series of optimizer failures from a single supply batch (9 claims in March, batch LOT-2451). The distributor has accepted the warranty claims; the direct cost to us is negligible so far, but each replacement consumes half a day of a service crew. Excluding LOT-2451, the quarterly defect rate was in line with historical norms (0.4% of installed components).

Customer satisfaction (post-commissioning survey, 5-point scale) averaged 4.7 across the quarter; the two sub-4 scores both concerned communication about rescheduled dates, not workmanship. Monitoring-portal activation within 7 days of commissioning reached 92% (target 90%).

9. Procurement and supply chain

Inverter supply. Lead times at our main distributor have stretched from 2 to 5–6 weeks; prices are up about 7% since January. The planned inverter warehouse (to be financed with the working-capital loan) is meant to secure a 6–8 week buffer for the installation crews. Panels and mounting systems remain readily available with stable pricing.

We currently source optimizers from a single manufacturer; the LOT-2451 episode argues for qualifying a second supplier before the warehouse is stocked. Cabling and small materials were moved to a consignment arrangement in February, freeing roughly $18k of working capital.

10. Regulatory environment

Ongoing discussion around changes to the net-billing scheme keeps residential customers hesitant; we partly offset this with a growing share of commercial clients, for whom the decision is a straightforward cost calculation. Grid-connection approval times in the North region improved slightly (median 21 days, from 26), while the South remains the slowest at 34 days.

11. Finance notes

Gross margin for the quarter came in at 31.2% (Q4: 29.8%), helped by the commercial mix and the consignment arrangement. Receivables are healthy: DSO of 24 days, one overdue invoice ($6.2k, commercial, payment plan agreed). Cash position at the end of March covers approximately 9 weeks of operating costs, which is precisely why the inverter warehouse requires external financing rather than cash purchase.

12. Plans for Q2

Priorities: (1) opening the inverter warehouse in the North region — conditional on a positive credit decision from the bank, for which this report is being prepared; (2) recruiting and onboarding two additional installation crews; (3) a decision on the 0.9 MWp solar farm RFP — attractive revenue-wise, but well beyond our current delivery capacity; (4) completing the CRM data hygiene work started by the back office, including entry procedures for subcontractors.

Working document — not for external distribution without board approval.

Appendix A — Installation register, Q1 2026 (CRM)

Full list of installations recorded in the CRM for the quarter, as of 5 April 2026. Type: RES = residential, COM = commercial. 'Entered by' indicates which team created the CRM record.
